1 Introduction

StateConvert is a utility which converts between the exciting `STATE.OUT` binary file and the `STATE.xml` XML file (the place where the density and the potential as well as the magnetization and the B-field are stored).

2 Usage

No input file is required. The program expects either `STATE.OUT` or `STATE.xml` to be located in the current working directory and performs a conversion to the XML format if a binary `STATE`-file is present or to the binary format if an XML `STATE`-file is present.
